Name: $\qquad$

1. In winter why does the temperature not rise more than a few degrees above freezing as long as there is snow cover?
2. Joe ( 70 kg ) rides his 5.0 kg sled 30.0 meters down a steep snowy mountain that makes an angle of $25^{\circ}$ with the horizontal. The coefficient of friction between the sled and the incline is 0.15 .
a. Use the concepts of work and energy to solve for the final velocity of the sled.
b. Now use Newton's Laws to solve for the final velocity (this should match your value from a).
c. How much snow is melted by the sled if the snow is at $0^{\circ} \mathrm{C}$ ?
3. A 1200 kg car traveling at $30 \mathrm{~m} / \mathrm{s}$ quickly brakes to a halt. The kinetic energy of the car is converted to thermal energy of the disk brakes. The brake disks (one per wheel) are iron disks with a mass of 4.0 kg . Estimate the temperature rise of each disk as the car stops.
4. A 5 kg block of ice is initially at $-65^{\circ} \mathrm{C}$ and then combined with 1 kg of steam at $110^{\circ} \mathrm{C}$. What is the final temperature of the system, what is the final mass of ice, water and steam?

1. The energy from the sun is in the far of radiation. It typically is transformed in to thermal reg wherit's absorbed by the grand ane ar. This thermal elegy car either go into increasing the tupeatere of the objects wa a phase charge.
Snow at $32^{\circ}+00^{\circ} \mathrm{C}$ is at the melting pout of eater so the leg from the sun has bo melt the snow blue it car rave the tempuatre of the sow. It takes a lot more elegy to convert ice to water pe K.logran thar it does to nerease the temperature So the snow has to melt before it car became a ne warm day.
2. Kinetic eregg, of the car is convected to thermal elegy of the brake discs. $K=$ En This thermal eng heats the dies. $Q=$ mont. Dintlorget the Kinetieregy is Minded between the 4 discs.

4. Fist I will determine how much energy is lost when the steam cools from 110 to $100^{\circ} \mathrm{C}$. There'll find evergy lost when steam underses tolip-ill wore. Then Ill compare the to the heat gaved by the ne when it's temperature is inveased from $-\cos ^{\circ} \mathrm{C}$ to $0^{\circ} \mathrm{C}$ plus the heat gavid by melting the ne.
Sleanfon 110 b $100^{\circ} \mathrm{C} \quad m c \Delta T=1.0 \mathrm{~kg} 2010 \mathrm{~J} / \mathrm{gk}(100-110)=-20,100 \mathrm{~J}$ Stan to water (conduce) $-m_{L_{v}}=1.07 \mathrm{~g} 226 \times 10^{6} \mathrm{~J} / \mathrm{kg}=\frac{-2,260,000 \mathrm{~J}}{-\frac{\mathrm{J}}{2.280,100 \mathrm{~J}}}$
ice from -65 to $0^{\circ} \mathrm{C}$ ice to water (melt)

$$
\begin{aligned}
& \text { MEAT }=5.01 \mathrm{~g} 2090 \mathrm{~J} / \mathrm{gk}(0-65)=679,250 \mathrm{~J} \\
& M_{L F}=5.0 \mathrm{~kg} 333 \times 10^{5 \mathrm{~J} / \mathrm{kg}}=\frac{1,665,000 \mathrm{~J}}{2,344,250 \mathrm{~J}}
\end{aligned}
$$

When you aralyze the above values you car see that it takes more heat to warm the ice (-65to0) and melt the ice thar it does to cool the $5 \operatorname{tean}(110 t 0100)$ and condurse the steam.
So you need more heat ont of the steen to fin sh melting the -i.. The math above leaves the steanat lour and the re e at $0^{\circ} \mathrm{C}$ so thees 5 till aterpeake dffeerce Le ts check to see if the is cough energy available in the hot water that was stean to melt the re many ice.
conduced steam felon $100^{\circ} \mathrm{C}+00^{\circ} \mathrm{C} \quad \mathrm{mCAT}=100 \mathrm{~kg} 4156 \mathrm{~J} / \mathrm{gK} \quad(\mathrm{K}-100)=418,000 \mathrm{~J}$ We needed $2,344,200 \mathrm{~J}-2280,100=64,100 \mathrm{~J}$ and the hot water has $418,600 \mathrm{~J} 50$ it will easily melt all the ce. So we now knew TF, s between $0^{\circ} \mathrm{C} \$ 100^{\circ} \mathrm{C}$ and all of our ice a steam have been convertal to liquid mate.
